Use this reference to determine the correct level of care **before** calling for transport. The level of care dictates whether you call Royal Dispatch directly or go through HPSM.

BLS Basic Life Support

Call Royal Dispatch directly. Patient requires basic medical monitoring during transport.

- Stable patients needing stretcher transport
- Oxygen administration (nasal cannula, simple mask)
- Basic vitals monitoring (BP, pulse, SpO2)
- IV maintenance (no new starts or medication pushes)
- Blood glucose monitoring and treatment
- Non-emergency transfers between facilities

Common examples: Dialysis transfers, SNF to hospital for routine appointments, stable post-surgical patients, discharge transports requiring a stretcher.

ALS Advanced Life Support

Call Royal Dispatch directly. Patient requires advanced interventions beyond BLS capabilities.

- Cardiac monitoring (12-lead ECG interpretation)
- IV medication administration (medications not on an IV pump)
- Advanced airway management
- Patients with unstable vitals or risk of deterioration

Common examples: Chest pain patients, acute stroke transfers, patients on IV drips (non-vasopressor), sepsis patients needing higher-level monitoring.

CCT Critical Care Transport

Call Royal Dispatch directly. Patient requires ICU-level care and monitoring during transport.

- Ventilator management (mechanical ventilation)
- Vasopressor / vasoactive drip management
- Invasive hemodynamic monitoring (arterial lines)
- Chest tube management
- **EVD** (External Ventricular Drain) management
- **MCS** (Mechanical Circulatory Support) — Impella, IABP, LVAD
- Patients requiring 1:1 RN or RT attendance

Common examples: ICU-to-ICU transfers, patients on multiple pressors, ventilated patients, ECMO transports, neuro patients with EVDs, MCS-supported patients, post-cardiac arrest stabilization transfers.

WC / SV Wheelchair & Stretcher Van / Gurney

Call HPSM first to arrange transport. Patient does NOT require medical monitoring during transport.

- Patient can sit upright in a wheelchair for transport
- Patient needs a stretcher/gurney but no medical care en route
- No oxygen, IV, cardiac monitoring, or medication needs
- Non-emergency, routine appointments and discharges

Common examples: Doctor appointments, dialysis (ambulatory), routine discharges of stable patients who cannot use personal vehicles, SNF transfers without medical needs.

IMPORTANT: HPSM NEMT AUTHORIZATION

For **Wheelchair and Stretcher Van** transports, SMMC must order through HPSM so that HPSM covers the cost. Only if HPSM cannot fulfill the transport should you escalate to Royal Dispatch. Refer to the front-side workflow for the complete decision tree and billing designations.
